Contents

1 STL

1.1 Vectors

```
// Details about stl vector

#include <vector>

using namespace std;

int main() {

    vector<int> v1;
    vector<int> v2 = v1; // make a copy
    vector<int> v3(v1); // identical to v2's init above
    vector<int> v4(1000); // specify size: 1000 0's
    vector<int> v6(v1.begin(), v1.end()); //[begin, end] from another array

    return 0;
}
```

1.2 Map

```
// Details about stl map in C++

#include <map>

using namespace std;

int main() {

    map<string, int> M;
    M["A"] = 1;
    M.find("A") != M.end();
    M.erase("A");

    //traversing iterator = pair<key, value>, ie. it->second;
    //operator[] vs. map::find()
    //find() preserves map contents
    //[] creates non-existent elements
    //use find() in loops
    //Set & Map are stored as R-B trees
    return 0;
}
```

2 Geometry

2.1 Convex hull

```
// Compute the 2D convex hull of a set of points using the monotone chain
// algorithm.  Eliminate redundant points from the hull if REMOVE_REDUNDANT is
// #defined.
//
// Running time: O(n log n)
//
//   INPUT:   a vector of input points, unordered.
//   OUTPUT:  a vector of points in the convex hull, counterclockwise, starting
//            with bottommost/leftmost point

#include <cstdio>
#include <cassert>
#include <vector>
#include <algorithm>
#include <cmath>
// BEGIN CUT
#include <map>
// END CUT

using namespace std;

#define REMOVE_REDUNDANT
